About us

Five Operating Divisions

A photograph of a DHL Express employee wearing a red and yellow high-visibility jacket, standing outdoors in a snowy environment.

DHL Express
International time-definite shipments

A photograph of a group of four DHL Global Forwarding, Freight employees in high-visibility vests standing in front of shipping containers at a port.

DHL Global Forwarding, Freight
Air, ocean and overland freight forwarding services

A photograph of a DHL Supply Chain employee wearing a yellow high-visibility vest, standing in a warehouse aisle.

DHL Supply Chain
Tailor-made logistics services and supply chain solutions

A photograph of a DHL eCommerce employee in a yellow vest holding a package, standing in front of a yellow delivery van.

DHL eCommerce
Domestic parcel transport; deferred cross-border services

A photograph of two Post & Parcel Germany employees standing in front of a yellow post station with a digital screen.

Post & Parcel Germany
Nationwide post and parcel network in Germany

Opportunity

Objective

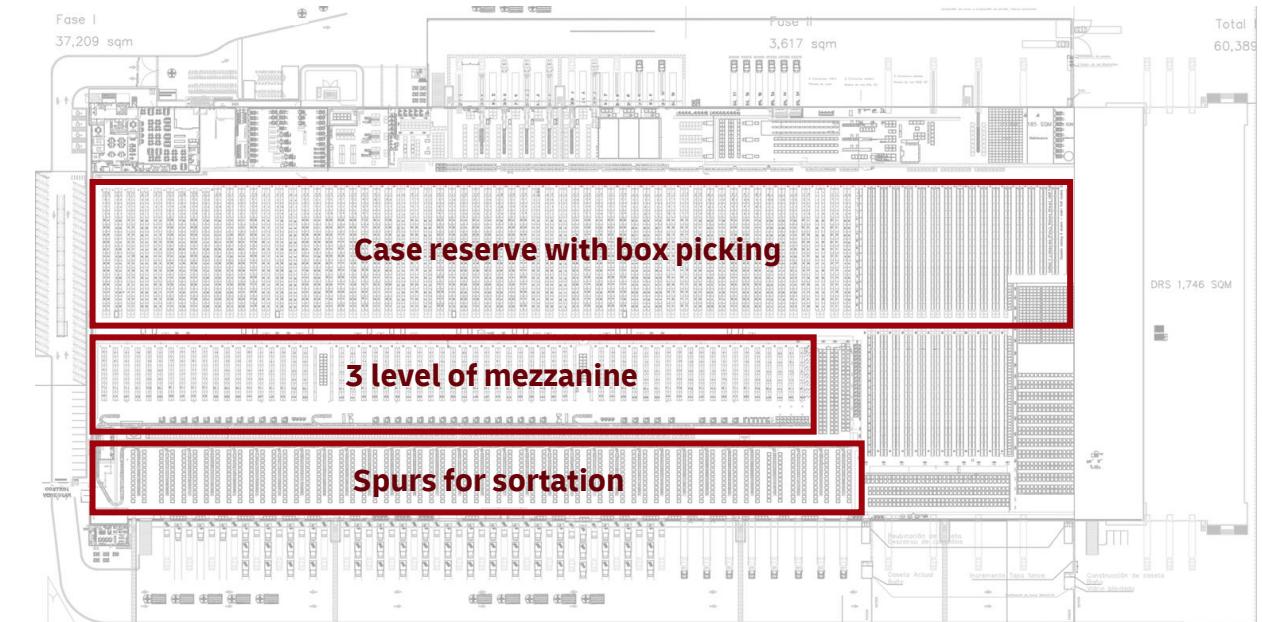

- Customer with more than **3m€ AGP** opportunity in warehousing
- This development is for Site team for better Operation management backed by Simulation.
- Cloud based Simulator**

Site Profile

- Opportunity type : Warehousing
- Sector : Retail
- Site Area : ~ 50k sq. m
- Storage profile : Mezzanine and Racks
- Product profile : Footwear, Apparel and Equipment
- Pick Profile : Units (Mezzanine), Cases(Racks)
- Slotting : Fixed (re-slotting)

Operational profile

Orders/Day:	~9000	Avg. FTEs: ~1,000
Lines/Day:	~30000	Active SKUs: ~70k
Picking distribution:	70% lines from mezzanine

MODELLING &
VALIDATION**

Simulator – Metrics

KPIs and metrics enable users to read and correctly interpret the models to drive decision making.

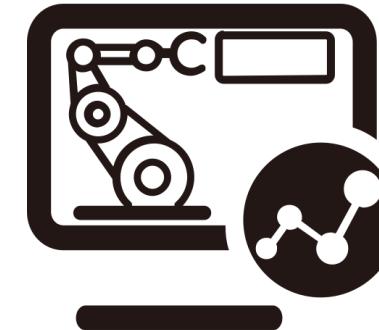

Turn Around Time

Represents the time it takes to perform an activity/tasks. For example: Time it takes to complete Wave, Tasks, Order, Shipment etc.

Congestion

Measures congestion/bottlenecks in the operations leading to higher wait time. For example: Congestion in Conveyor, Queuing to pick items etc.

Resource Utilization

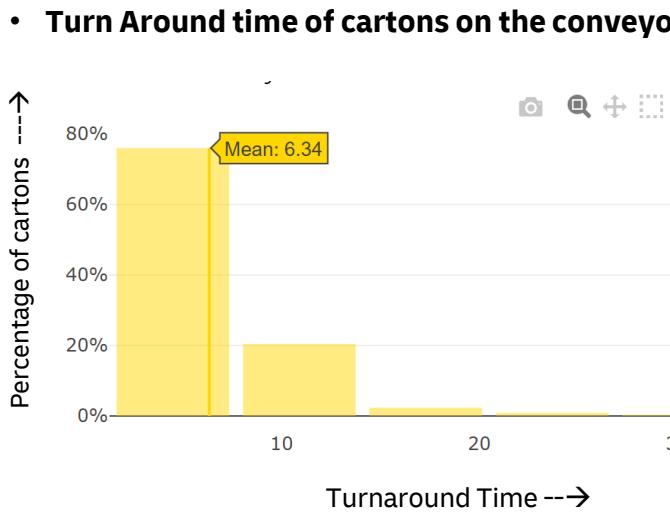

Represents the utilization of the resources currently occupied in performing activities. For example: How well are we utilizing resources for picking, packing, VAS and sorting activity etc.

Metrics details as in the model

KPIs and metrics enable users to read and correctly interpret the models to drive decision making

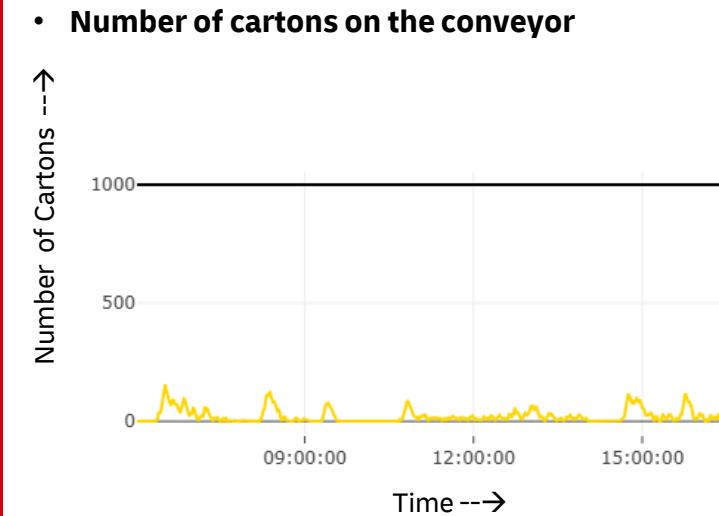

Turn Around Time

- Distribution of turnaround time calculated for each carton.
- The data shows that:
 - The mean turnaround time is approximately 6.3 minutes for about 80% of the cartons.

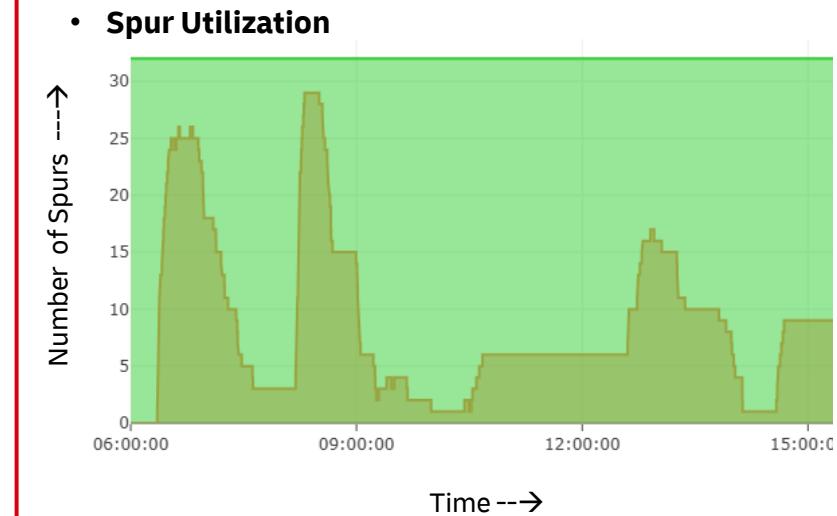

Congestion

- Shows real-time carton count on the conveyor over time.
- A black line indicates the maximum allowable cartons to prevent blockage.
- Increases in carton numbers reflect conveyor congestion over time.

Resource Utilization

- The graph indicates the number of spurs needed over a specific time interval.
- A dark green line represents the maximum number of spurs available, currently set at 32.
- This graph can be used to understand spur utilization over time.

Simulator - Model validation

Simulation Model was able to represent outbound process which enables operations to test scenarios before rolling out strategies/initiatives

Operational Model

Average **298** minutes

Average **118** minutes

Average **122** minutes

Average **13** minutes

Average **4** minutes

Wave TAT

SCENARIO ANALYSIS

Slotting challenge and Improvement opportunity

Enhancing Picking Efficiency and reducing pick and pass orders: The Power of Slotting

Baseline Scenario

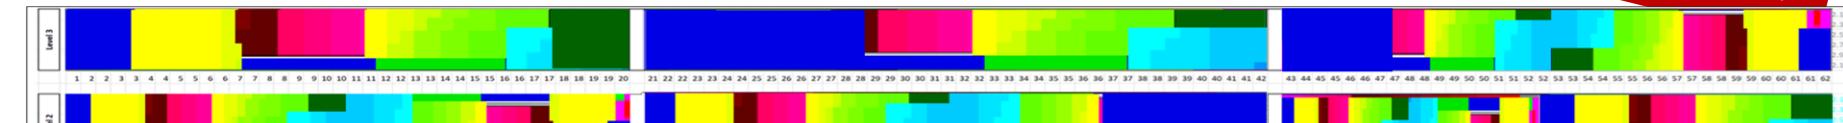

High SKU Dispersion: Significant dispersion of SKUs (e.g. sportswear) across multiple aisles, it is Present in 58 aisles at Level 1 and 47 aisles at Level 2, despite needing SKUs for only 47 total aisles.
Increased Distance for Picking.

Slotting Scenario

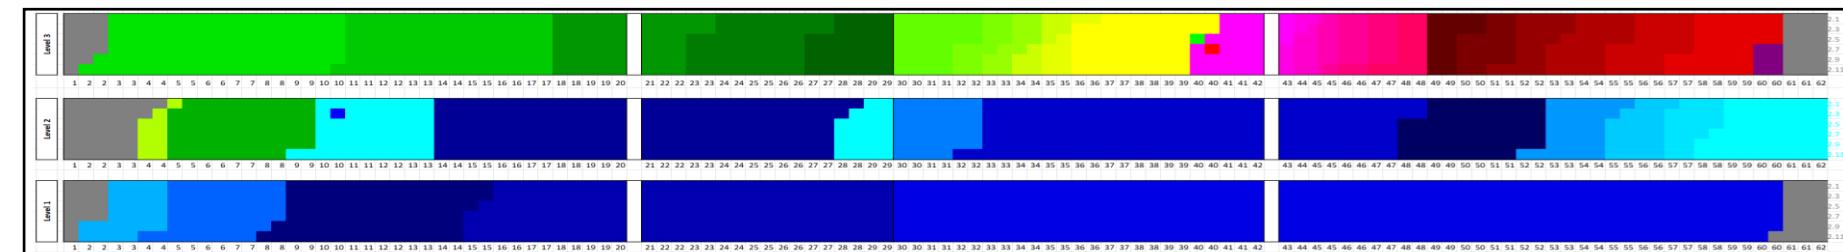

Reduce SKU Dispersion: Consolidate SKUs into fewer aisles (align with 47 total aisles needed on the same level).
Decrease Picking Distance: Shorten travel time for pickers by optimizing SKU placement.
Efficient task creation: less pick and pass orders

As-Is Scenario	To-Be Scenario
#Distinct Aisles Visited/Order	#Distinct Aisles Visited/Order
2.08	1.78
Avg. Distance Travelled to Start Picking Process (in #Aisles)	Avg. Distance Travelled to Start Picking Process (in #Aisles)
13.31	10.04
Avg. Distance Travelled During Picking Process (in #Aisles)	Avg. Distance Travelled During Picking Process (in #Aisles)
8.16	5.11
%Pick & Pass	%Pick & Pass
29.15%	24.82%
%Multilevel	%Multilevel
23.00%	20.99%

APPLICATION: SCENARIO BUILDING

Application: Data preparation and Scenario building

Application helps in cleaning and transforming data required for Scenario analysis

- Key Features of application:**
 - Desktop Application (one time installation)
 - Time-Saving and User friendly
 - Flexibility in creating Scenarios
 - API Based task creation – Optimization algorithm to represent order grouping logic
- Types of Scenario**
 - Slotting (Case reserve/Mezzanine)
 - Waving (time interval based)
 - Shift timings (user input)
- Using The Application:**
 - Launch the Application
 - Selecting the AT-Report File
 - Updating Slotting Results
 - Defining Waving Time Interval
 - Finalizing Shift Timings

THANK YOU
